## ANNEX 1

### ***Climate refugees: who are they?***

According to the report of the Intergovernmental Panel on Climate Change (IPCC), three consequences of climate warming appear to be the most threatening potential causes of forced migration. If no effort is made to protect the groups of people at risk, then they have no alternative but to emigrate.

The reasons are:

1. Hurricanes, torrential rains and floods
2. Drought and desertification
3. Rising sea levels

**Yemen, China, Louisiana, Tuvalu, Kiribati, Bangladesh, Morocco, Tunisia, Libya, Egypt, Turkey, Vietnam, Niger, Ghana, Ecuador, Mexico, Argentina** are reported at heavy risk if no precaution is made.

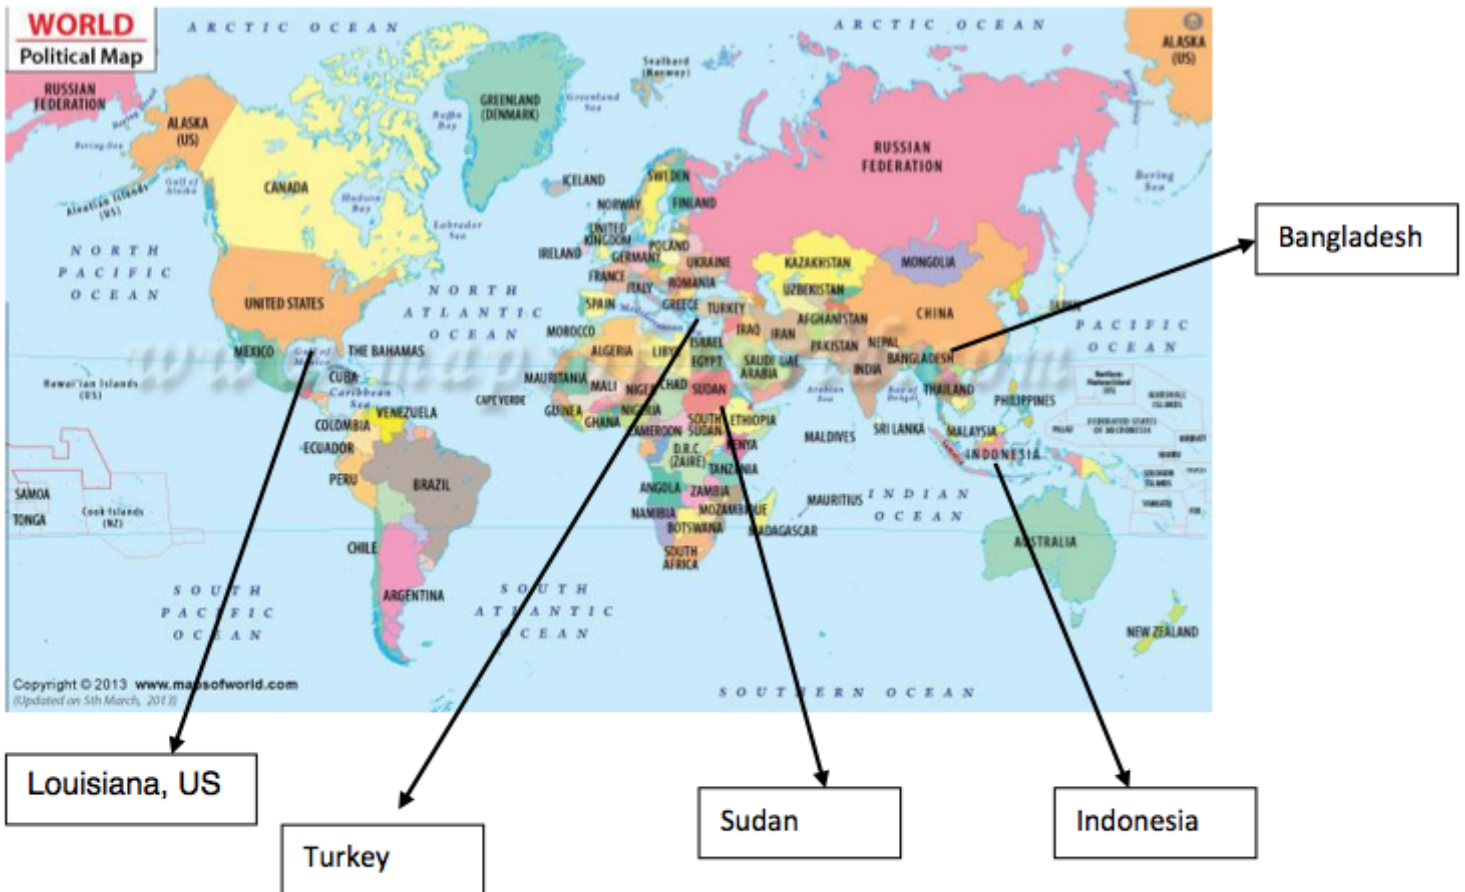

Climate refugee situation is not a problem of “one country” or “one continent”. It is a global problem that millions of people are affected by the consequences of climate change, not just a problem of a specific country.

## INTEGRATION THROUGH EDUCATION

The climate refugee situation is not too “local” as we can see from the map below

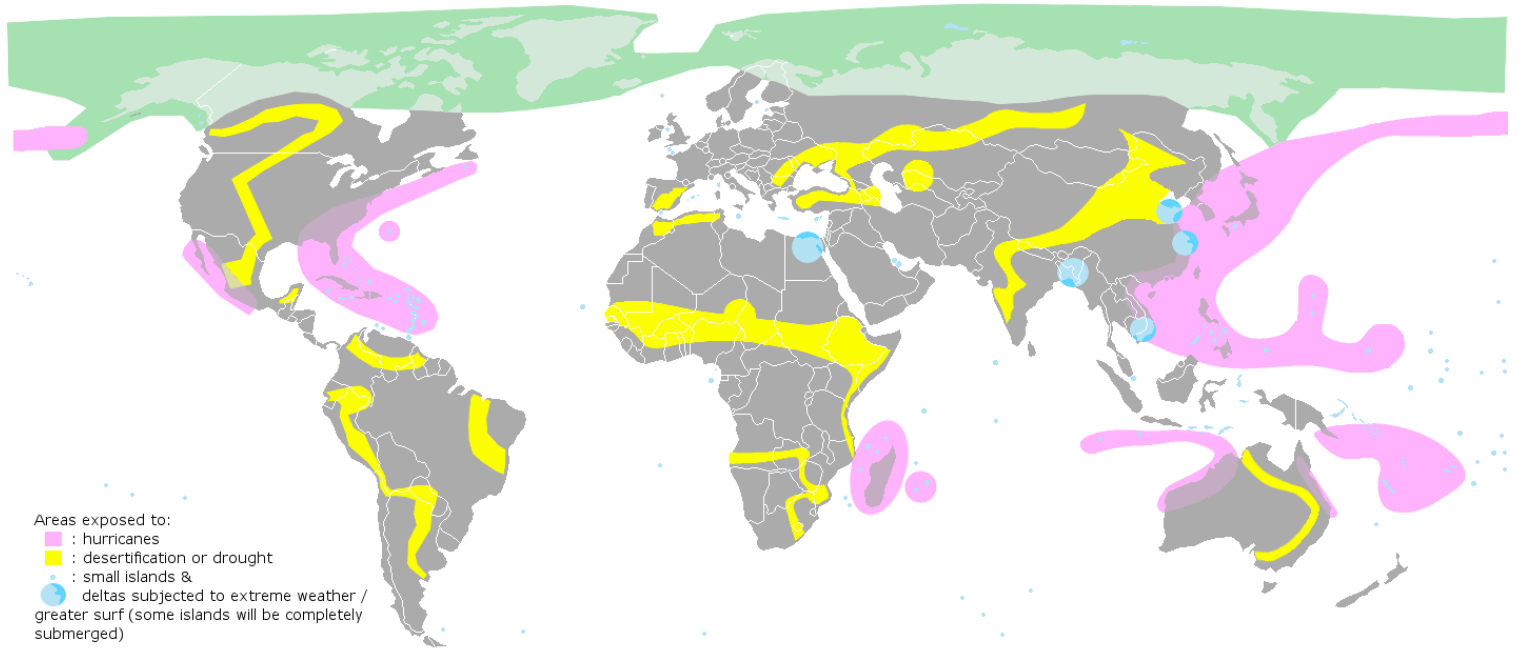

Climate refugees: who are they?
